

We undertake structural, diagnostic and geotechnical monitoring on buildings, bridges, car parks and industrial premises.

We have a specialist facility for monitoring noise, vibration and environmental dust and gases. Surveys of structures are undertaken to assess the nature and extent of any defects, their probable cause and to allow development of repair strategies.

Our Testing and Analysis team consists of specialist engineers who oversee contracts from start to finish

ensuring a consistency of service and attention for our Clients. Our resources are deployed throughout the UK with personnel located in the South East, South West, Midlands, North West, North East and Scotland. This decentralisation improves our service to the Client through quick response times and local knowledge.

We continue to improve our services by investing in state of the art equipment.

We have worked with a wide variety of clients, including local governments, utility companies and consulting engineers. Our clients appreciate the performance, expertise, quality and professionalism of our focused, customer driven approach.

As well as providing the conventional diagnostic and structural investigation services, we can offer highly specialised tests, such as dynamic resonant frequency testing of floors and sound insulation testing. We also have the expertise to create bespoke systems to meet specific client requirements.

Having undertaken pile testing since 1979, we are also established as worldwide experts for dynamic pile testing, sonic logging and integrity testing of piles (all of which are UKAS accredited).
